Algorithmic Trading Strategies in Borsa Istanbul (BIST)

How different strategies detect opportunities, manage risk, and behave across different stocks

Algorithmic Trading Strategies in BIST

How different strategies detect opportunities, manage risk, and behave across stocks

Big idea

A strategy is not a magic formula. It is a structured question asked to the market.

In BIST, different stocks can show different behavior: strong trends, sideways ranges, sudden volume events, or reversal zones.

A good lesson compares strategies by asking what each one is designed to detect.

Trend

Price keeps moving in one direction.

Range

Price moves sideways between levels.

Volume Event

Unusual activity appears suddenly.

Reversal

A move loses strength and turns.

Main lesson: The real question is not “Which strategy is always best?”
The real question is “Which market behavior does each strategy try to detect?”

Why Do We Need Different Strategies?

Because market behavior changes from stock to stock and from period to period

Markets do not always behave the same way.

A method that works well in a strong trend can fail in a sideways market.
A reversal method may be useful near exhaustion, but weak during a powerful breakout.

1. **Trending Market**
   Momentum strategy may work well
2. **Sideways Market**
   Mean-reversion logic may be better
3. **High-Volume Event**
   Volume / liquidity strategy may react
4. **Reversal Area**
   Reversal strategy may become useful

One stock can trend. Another can chop.

TRENDING MARKET

Price keeps moving higher.
A momentum strategy may catch a large move.

↗

SIDEWAYS MARKET

Price moves up and down.
The same signal can stop out many times.

↔

So we need a toolbox, not a single tool.

For example, if the price moves like this:
100 → 105 → 110 → 120
we have a clear upward trend. A momentum strategy may perform well because the price keeps moving in the same direction.
But if the price moves like this:
100 → 105 → 99 → 104 → 98 → 103
the market is Sideways (Unclear trend). The price moves up and down without a clear direction, so a momentum strategy may produce more false signals and stop-outs.

The Strategies We Will Study

Each strategy is a different way of asking the market a question

1 **Volume Bubbles**

“Is unusual buying or selling pressure appearing?”

2 **Liquidity Swings**

“Is price reacting around liquidity areas?”

3 **Support & Resistance Channels**

“Is price near, breaking, or rejecting a key zone?”

4 **Dual-Phase Reversal**

“Has a price sequence become exhausted enough to reverse?”

We will not memorize signals. We will explain the market logic behind each strategy: what it sees, why it enters, how it manages risk, and why results differ across BIST stocks.

A Common Framework for All Strategies

Use the same eight questions to explain every algorithmic trading system

1. **Input Data** — What data does it use?
2. **Signal Detection** — What event does it detect?
3. **Filters** — Which extra conditions must be true?
4. **Entry** — When does it buy or sell?
5. **Initial Stop** — Where is the first risk boundary?
6. **Trade Management** — How does it manage the open trade?
7. **Exit** — When does the trade close?
8. **Performance** — How well did it work?

Example: Volume Bubbles

Input data = lower-timeframe volume
Signal = unusual positive or negative delta cluster
Filter = market context check
Entry = valid buyer or seller cluster
Exit = stop, trailing stop, target, or time rule

One framework makes strategies comparable.

Instead of asking “Is this strategy good or bad?”, ask:

- What behavior does it detect?
- What market regime does it prefer?
- How does it control risk?
- Do results come from entries or exits?

Volume Bubbles Strategy — Visual Pseudocode Guide

How the strategy detects unusual buying/selling pressure and manages trades

1 / 4
Mini Visual Lesson Series

1. **Lower-timeframe volume data**
   Use intraday volume (e.g., 1–5 minute).
2. **Estimate buy volume and sell volume**
   Split volume into buyer-initiated and seller-initiated volume.
3. **Compute Net Delta = Buy Volume – Sell Volume**
   Positive delta = buyers stronger, negative delta = sellers stronger.
4. **Compare today's Volume / |Delta| with historical percentiles**
   Find unusually high activity compared to history.
5. **Classify cluster: Small / Medium / Big**
   Based on the size of volume and delta relative to historical percentiles.
6. **Decide: Buyer Cluster or Seller Cluster?**
   If delta is positive → buyer cluster.
   If delta is negative → seller cluster.
7. **If valid entry signal appears → Enter trade**
   Follow the strategy rules for confirmation (e.g., cluster size, trend filter, etc.).
8. **Protect with stop + optional trailing stop**
   Set initial stop and use trailing stop to protect profits as the trade moves in favor.

Example: How the Strategy Works on a Chart

Key Ideas

1. Delta shows who dominates: buyers or sellers.
2. Clusters mark unusually strong activity.
3. Big clusters are rare and more important.
4. The strategy tries to ride strong trends.

Legend

- **Green bubble** = buyer cluster (unusually strong buying pressure)
- **Red bubble** = seller cluster (unusually strong selling pressure)
- **Yellow bubble** = mixed / unclear (no clear dominance)
- **Red step line** = stop / **trailing** stop (initial stop and then trailing stop)

Stop: Used to limit losses.
Trailing Stop: Used to protect profits while allowing the trade to stay open as long as the trend continues.

Understanding Delta, Clusters, and Percentiles

What the strategy is measuring before it opens a trade

1 What is Delta?

Net Delta = Buy Volume − Sell Volume

Example A:

Buy Volume	1,500,000
Sell Volume	900,000
Net Delta	**+600,000**

buyers dominate

Example B:

Buy Volume	700,000
Sell Volume	1,100,000
Net Delta	**−400,000**

sellers dominate

Positive delta does NOT guarantee price will rise — it only shows stronger buying pressure inside that bar.

2 What is a Cluster?

A cluster is a bar or zone with unusually strong volume and/or delta compared with recent history.

Small cluster
= unusual activity

Larger than normal, but not extreme.

Medium cluster
= stronger activity

Significantly larger than normal.

Big cluster
= very rare activity

One of the largest events in recent history.

3 What does Percentile mean?

A percentile shows how large today's volume or |delta| is compared with recent historical observations.

97th percentile means this event is stronger than about 97 out of 100 recent observations.

Selected threshold exceeded = today's volume or |delta| is larger than the chosen historical cutoff.

4 How to read a signal label

BUY 71.60 — Big Cluster

1. The strategy saw an unusually strong positive delta cluster.
2. It opened a long trade near 71.60.
3. This does **NOT** mean the stock is cheap; it means strong buying pressure appeared.

Legend

- **Green bubble** = buyer cluster (unusually strong buying pressure)
- **Red bubble** = seller cluster (unusually strong selling pressure)
- **Yellow bubble** = mixed / unclear (no clear dominance)

Trade Management: Entry, Stop, 1R, and Trailing Stop

How the strategy protects risk and lets strong trends run

3 / 4
Mini Visual Lesson Series

1 Entry
If a valid buyer cluster appears, open a long trade.

2 Initial Stop
Place the stop below the cluster candle low (or use ATR, depending on settings).

3 Risk Unit (R)
R = Entry Price – Initial Stop.

4 +1R Activation
When price moves up by 1R, trailing stop can activate.

5 Trailing Stop
The stop moves up as price moves in favor.

6 Exit
The trade closes if stop is touched, target is hit, or another exit rule applies.

Example: Trade Lifecycle with Real Numbers

1	**Entry**	**71.60**
2	**Initial Stop**	**67.66**
3	**Risk Unit (R)**	71.60 – 67.66 = **3.94**
4	**+1R level**	**75.54** (71.60 + 3.94)
5	**Later in the trade**	Price rises to 90 and the trailing stop has climbed to 84.
6	**Exit trigger**	A drop to 84 triggers exit (when stop is touched).

Example result:
Entry 71.60 → Exit 84.00 ≈ +17%

How the Initial Stop is Calculated?

Initial Stop = Cluster Candle Low × (1 – Buffer)

Cluster Candle Low = 68.00
Buffer = 0.5%
Initial Stop = 68.00 × 0.995 = **67.66**

The stop is placed slightly below the cluster candle low.

Trailing Stop in Plain English

Trailing stop = a moving protective stop that follows the trend from below.

Why Results Differ Across Stocks

The same strategy behaves differently in trending and sideways market structures.

4 / 4
Mini Visual Lesson Series

1 A) Trend-friendly stocks

ASELS | AKBNK | TUPRS

1. Strong positive clusters are followed by **sustained price expansion.**
2. **Trailing stop** keeps the trade alive while the trend continues.
3. A few large winners can **dominate total performance.**

2 B) Sideways / mean-reverting stocks (unclear trend)

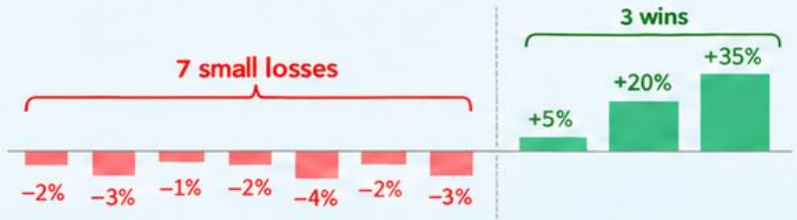

TCELL | FROTO | EREGL

1. Buyer clusters appear, but price often **reverses quickly.**
2. The strategy enters, but **repeated stop-outs** reduce win rate.
3. **Many small losses** occur before a bigger move appears.

3 C) Positive Skew

Positive skew = **many small losses + a few very large gains.**

Example:
7 small losses:
−2%, −3%, −1%, −2%, −4%, −2%, −3%

3 wins:
+5%, +20%, +35%

Net result can still be strongly positive.

4 D) What to improve

1. Add a **trend filter** (for example, price above SMA200).
2. Use **stricter consensus** between windows.
3. Raise **percentile thresholds** for medium and big clusters.
4. Require both **Volume and Delta** confirmation.
5. Test trailing-stop activation at **1R vs 1.5R vs 2R.**

Control Test

If random or fixed-interval entries produce similar results, the main edge may come more from the **exit system (trailing stop)** than from the entry signal itself.

Core idea: This is a momentum strategy. It looks for unusually strong buying pressure, then tries to ride the trend with disciplined risk control.

VOLUME BUBBLES STRATEGY

The Big Idea

The strategy does not start with “cheap or expensive”.

It does not read balance sheets. It does not ask if the company is undervalued.

It asks one simple question.

“Is unusual buying or selling pressure appearing right now?”

If the answer is yes, it marks a bubble.

Then the trade is managed with a stop and, if price moves well, a trailing stop.

Find unusual pressure → enter only if the signal is valid → protect the trade → let strong trends run.

Signal + Risk Control

1. What is Delta?

Delta compares buying pressure and selling pressure inside one candle.

Net Delta = Buy Volume – Sell Volume

Buy Volume	1,500,000 lots
Sell Volume	900,000 lots
Net Delta	+600,000

Meaning: buyers were stronger in that candle.

Important: positive delta does not guarantee the next candle will rise. It only describes pressure inside this candle.

2. Positive Delta vs Negative Delta

Positive Net Delta

Buy Volume > Sell Volume

Example:
Buy = 150,000
Sell = 100,000
Delta = +50,000

Buyers dominate this candle.

Negative Net Delta

Sell Volume > Buy Volume

Example:
Buy = 70,000
Sell = 110,000
Delta = −40,000

Sellers dominate this candle.

3. What does “High Delta” mean?

High delta is relative.

A +20,000 delta may be huge for one stock and normal for another stock.

So the strategy compares today with recent history.

It asks: “Is today’s delta unusually large compared with this stock’s own past?”

Example:

Recent deltas: +5, +8, −3, +12, +7, +9. Today: +60. That is unusually high.

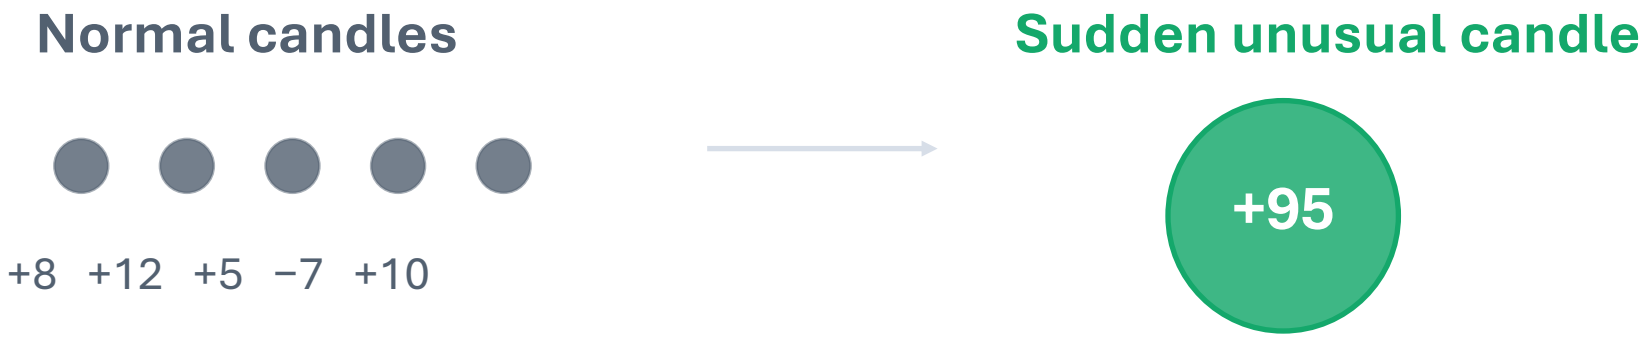

Simple idea

High delta = today’s buying/selling imbalance is much bigger than usual for this stock.

Unusual pressure

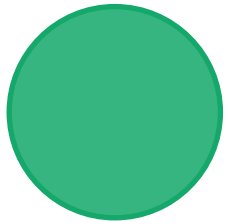

4. What is a Delta Cluster?

A cluster is a candle or zone with unusually strong volume and/or delta.

The strategy says:
“This is not normal. Mark it as a cluster.”

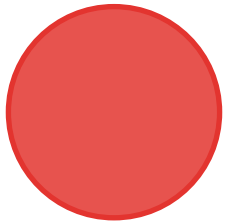

5. Bubble Colors

Green Bubble

Buyer cluster

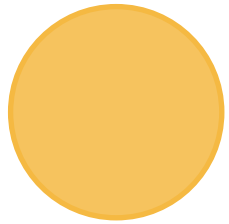

The candle closes positive, net delta is positive, and the threshold is exceeded.

Red Bubble

Seller cluster

The candle closes negative, net delta is negative, and the threshold is exceeded.

Yellow Bubble

Mixed / unclear

Activity is high, but the strategy cannot clearly classify it as buyer or seller.

6. Bubble Size and Percentiles

Size tells how rare the event is compared with recent history.

Small	76th percentile → unusual
Medium	90th percentile → stronger
Big	97th percentile → very rare

Example: 97th percentile

Imagine 100 recent delta values are ranked from small to large.

97th percentile means today's delta is stronger than about 97 of them.

Only about 3 are bigger.

Large bubble = rare event

7. How to Read “BUY 71.60 — Big Cluster”

BUY 71.60 — Big Cluster

It means:

1. The strategy saw a very strong positive delta cluster.
2. It opened a long trade near 71.60.
3. It does not mean the stock is cheap.
4. It means strong buying pressure appeared.

“Big” = signal strength

+1699 = position size / lots

Do not confuse them.

8. Entry

The strategy should not enter every green candle.

It enters only when the bubble is strong enough and the selected rules allow the trade.

Context filter OK? means: A signal may exist, but the strategy asks one more question:
“Is this signal happening in a suitable market environment?”

9. Initial Stop: The First Protection

A stop is a pre-defined risk boundary.

Entry	100 TL
Cluster low	95 TL
Buffer	0.5%
Stop	95 × 0.995 = 94.53 TL

If price falls to the stop, the trade closes.

The strategy does not “know” the future.
It only follows a rule:

“Below this level, my entry idea is wrong.”

10. Trailing Stop: A Stop that Follows Price

Trailing stop moves up when the trade moves in your favor.

Entry	100
Initial Stop	95
Price rises	105 → 110 → 120
Stop rises	95 → 99 → 104 → 112

In a long trade, trailing stop can move up — but it does not move down.

This protects profit while giving the trend room to continue.

11. What does “+1R Activation” mean?

R is the initial risk of the trade.

Entry	100
Stop	95
R	100 − 95 = 5
+1R level	100 + 5 = 105

Trailing stop activates only after price reaches +1R.

In this example, trailing begins near 105.
Before 105, the initial stop protects the trade.
After 105, the stop can start following price upward.

12. A “Stop” Exit can still be Profitable

Example:

Buy at 100. Initial stop is 95. Price rises to 125.

Trailing stop moves up.

The stop is now 116. This is above the entry price.

Price falls to 116.

The trade exits by stop, but the result is +16%.

Key lesson

The word “stop” does not always mean a loss. It means the exit rule was triggered.

+16% by stop

13. Why Results Differ Across Stocks

The same signal behaves differently in different market structures.

Trend-friendly

Examples: ASELS, AKBNK

Green clusters are followed by long moves.
Trailing stop keeps the trade alive.
A few large winners dominate.

Unclear trend / mean-reverting

Examples: TCELL, FROTO, EREGL

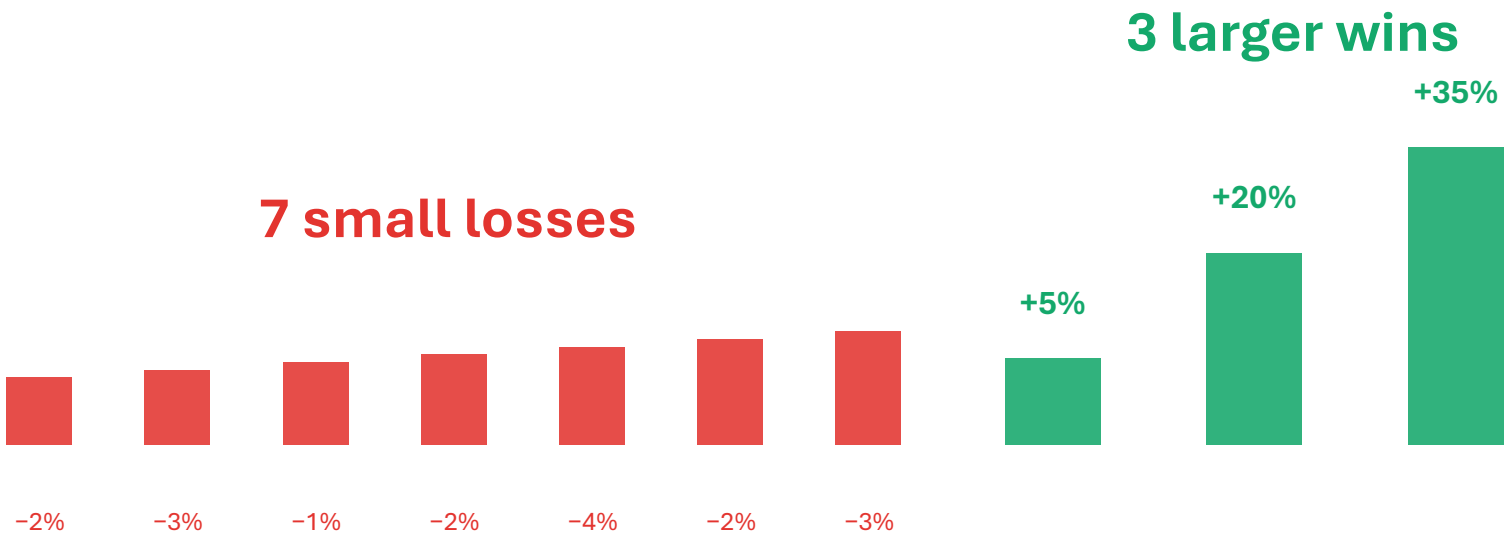

Buyer clusters appear, but price reverses quickly.
The strategy enters, then gets stopped.
Many small losses can happen.

The strategy works best when strong pressure is followed by trend continuation.

14. Positive Skew: Small Losses, Big Wins

This strategy does not need to win every trade.

It can work if losses are small and winners are much larger.

Math idea

Losses: −17%
Wins: +60%
Net: +43%

16. Improvement Ideas to Test

1. **Add a trend filter**

   Example: only long when price is above SMA200.

2. **Use stricter consensus**

   Require 2 of 3 windows to agree instead of any window.

3. **Raise thresholds**

   Use 92/98 or 95/99 to reduce weak signals.

4. **Require Volume + Delta**

   Both total volume and delta must be abnormal.

5. **Test +1R vs +1.5R vs +2R**

   Trailing stop may activate too early in volatile stocks.

Do not optimize only for one stock. Test the same settings across many stocks.

Volume Bubbles Strategy — BIST Test Results

Test period: 1 January 2025 – 28 September 2026

Stock	Net Profit	Total Trades	Winning Trades	Losing Trades	Win Rate
AKBNK	+₺84,000	13	7	6	53.8%
ASELS	+₺239,000	13	8	5	61.5%
TUPRS	+₺72,000	16	8	8	50.0%
TCELL	−₺18,000	17	4	13	23.5%
FROTO	+₺3,000	20	3	17	15.0%
EREGL	+₺39,000	17	5	12	29.4%

Key observation: A high win rate is not required for profitability; a few larger winners can offset many smaller losses.

What Do the Results Suggest?

A simple interpretation of the same backtest results

1

More balanced results

AKBNK, ASELS and TUPRS show around 50% or higher win rates and positive net profit.

Signal quality and trend continuation appear more balanced.

2

Low win rate can still survive

FROTO wins only 3 of 20 trades, yet the net result remains slightly positive.

A few larger winners can compensate for many small losses.

3

SIDEWAYS markets are difficult

TCELL and EREGL have lower win rates, suggesting repeated reversals and stop-outs.

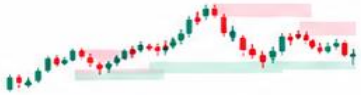

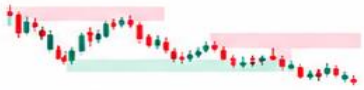

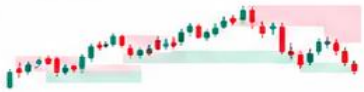

Momentum-style entries struggle when price does not continue in one direction.

Liquidity Swings Strategy — BIST Test Results

Liquidity Swings Strategy — Results Summary

1 / 4

Test period: 1 January 2025 – 28 September 2026

Stock	Price Chart (2025–2026)	Net Profit (TL)	Total Trades	Winning Trades	Losing Trades
AKBNK		+51k TL	3	2	1
TCELL		-9k TL	4	1	3
ASELS		+154k TL	4	3	1
TUPRS		+94k TL	3	2	1
FROTO		-7k TL	4	2	2
EREGL		-800 TL	5	3	2

Overall Assessment

Short takeaways about strategy performance

Strongest result:
ASELS

Strong results:
TUPRS and AKBNK

Weak results:
TCELL and FROTO

EREGL:
The win rate is decent, but the net result is weak.

Core idea: The same strategy does not work the same way on every stock; trend structure and breakout quality determine the result.

Liquidity Swings Strategy — BIST Test Results

Liquidity Swings Strategy — How Does the Logic Work?

2 / 4

Swings zones, breakouts, and position management

1 Swing High Zone

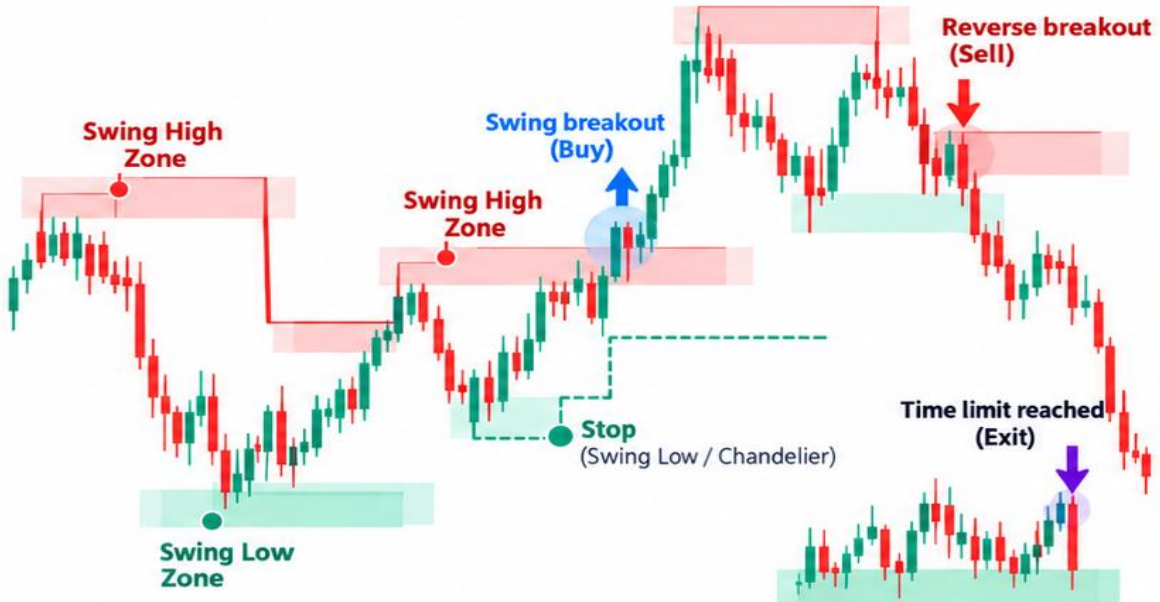

- The upper area where price previously struggled and liquidity is located.
- Selling pressure may increase in this area.
- It acts as resistance until a breakout occurs.

Swing High Zone (Resistance / Liquidity)

2 Swing Low Zone

- The lower area where price previously found support and liquidity is located.
- Buying interest may increase in this area.
- It acts as support until a breakdown occurs.

Swing Low Zone (Support / Liquidity)

3 Entry Logic (Long)

- If price closes above the Swing High zone, a 'swing breakout' occurs.
- This breakout suggests that liquidity has been taken and an upward move may begin.
- A long position can be opened after the breakout.

4 Protection (Stop)

- The stop is usually placed below the most recent Swing Low zone.
- Optionally, it can be managed with a Chandelier stop or a trailing stop.
- If price turns against the position, the trade is closed.

Strategy Workflow Steps

1. **Data** — Price data is monitored on the chart.
2. **Swing zones** — Swing High (upper zone) and Swing Low (lower zone) are identified.
3. **Breakout** — If price breaks above the Swing High zone, a long opportunity may appear; if it breaks below, a short opportunity may appear.
4. **Position management** — The stop is placed below Swing Low and managed with Chandelier / trailing stop.
5. **Exit** — The position is closed on a reverse breakout, stop, or time-limit exit.

Liquidity Swings Strategy — BIST Test Results

Why Did It Work Strongly in Some Stocks?

3 / 4

Trend-friendly stocks: AKBNK, ASELS, TUPRS

1 ASELS | 2 TUPRS | 3 AKBNK

AKBNK
+51k TL

3 trades	2 winners	1 loser

- Price was able to continue after the breakout.
- Few trades, but selective.
- Swing lows held.

ASELS
+154k TL

4 trades	3 winners	1 loser

- Gains grew because the trend extended.
- Breakout zones worked clearly.
- Swing lows held; the trend did not break.

TUPRS
+94k TL

3 trades	2 winners	1 loser

- Price continued strongly after the breakout.
- Few trades, but a high success rate.
- Long trend moves formed in a trend-friendly structure.

How Does Breakout → Trend Continuation Work?

Common feature: Instead of reversing after the breakout, price continued the trend.

Liquidity Swings Strategy — BIST Test Results

Why Did It Stay Weak in Some Stocks?

4 / 4

Examples: TCELL, FROTO, and EREGL

TCELL **-9k TL**

4 trades	1 winner	3 losers

- Price quickly reversed after the breakout.
- Sideways market / unclear trend.
- Pressure from stop-outs or reverse breakouts.

FROTO **-7k TL**

4 trades	2 winners	2 losers

- Winners and losers were balanced, but gains stayed small.
- Trend continuation was weak.

EREGL **-800 TL**

5 trades	3 winners	2 losers

- The win rate was not bad, but the winning trades were not large enough.
- The net result was close to break-even.

Repeated Breakouts in a Sideways Market (Example)

What Can Be Improved?

1. Add a trend filter.
2. Require stronger breakout confirmation.
3. Filter out sideways market periods.
4. Test stop and time-limit settings.

The Liquidity Swings strategy likes clean breakouts; it struggles more in sideways and uncertain markets.

Support Resistance Channel Strategy — BIST Test Results

Support & Resistance Channels Strategy: How It Works

A breakout strategy that buys resistance breaks and manages risk around support channels

1 Identify the channel

The strategy marks support and resistance zones using recent swing lows and swing highs.

2 Wait for a resistance breakout

A long trade is opened when price breaks above the resistance channel.

3 Use support as the risk reference

The support zone or channel floor helps define the initial stop. An optional Chandelier stop can trail the trade.

4 Hold while the trend continues

If price stays above the breakout area, the strategy lets the move run.

5 Exit when the breakout fails

The trade closes on a reverse breakdown, stop hit, or time-based exit.

Green zones = Support

Red zones = Resistance

Blue arrows = Long entry

Purple markers = Exit / reverse breakdown

Core idea: buy **real breakouts**, avoid failed breakouts, and protect the trade with disciplined exits.

Support Resistance Channel Strategy — BIST Test Results

Backtest Results Across 6 BIST Stocks

Support & Resistance Channels Strategy — Test Period: 1 Jan 2025 to 28 Sep 2026

Stock	Net Profit	Total Trades	Winning Trades	Losing Trades
AKBNK	-₺6k	27	12	15
TCELL	-₺30k	28	8	20
ASELS	+₺158k	12	5	7
TUPRS	+₺44k	8	4	4
FROTO	-₺23k	24	7	17
EREGL	+₺35k	24	9	15

Key Insights

1. **Profitable stocks:** ASELS, TUPRS, EREGL
2. **Losing stocks:** AKBNK, TCELL, FROTO
3. **Best profit:** ASELS (+₺158k)
4. **Most difficult stock:** TCELL (-₺30k)

Takeaway: Profitability depended more on breakout follow-through than on win rate alone.

Support Resistance Channel Strategy — BIST Test Results

Why Results Differ Across Stocks

The same breakout strategy behaves differently in strong trends and in failed-breakout environments

A Breakout-friendly stocks

ASELS TUPRS EREGL

1. Resistance breakouts are followed by stronger trend continuation.
2. There are fewer false breakouts and better follow-through.
3. A moderate win rate can still produce good profits because winners travel farther.

B Failed-breakout / SIDEWAYS stocks

AKBNK TCELL FROTO

1. Price breaks resistance, but continuation often fails quickly.
2. Repeated reverse-breakdown exits reduce performance.
3. More trades do not help if many of them are low-quality breakouts.

Core idea: this is a breakout strategy, so it works best when breakouts lead to real trend expansion.

Support Resistance Channel Strategy — BIST Test Results

How to Improve the Strategy

Practical ideas for reducing failed breakouts and improving trade quality

1 

Add a trend filter

For example, only take longs above SMA200.

2 

Require a stronger breakout confirmation

A clear close above resistance.

3 

Use volume confirmation

Avoid quiet breakouts with weak participation.

4 

Reduce overtrading

Require more distance or time between signals.

5 

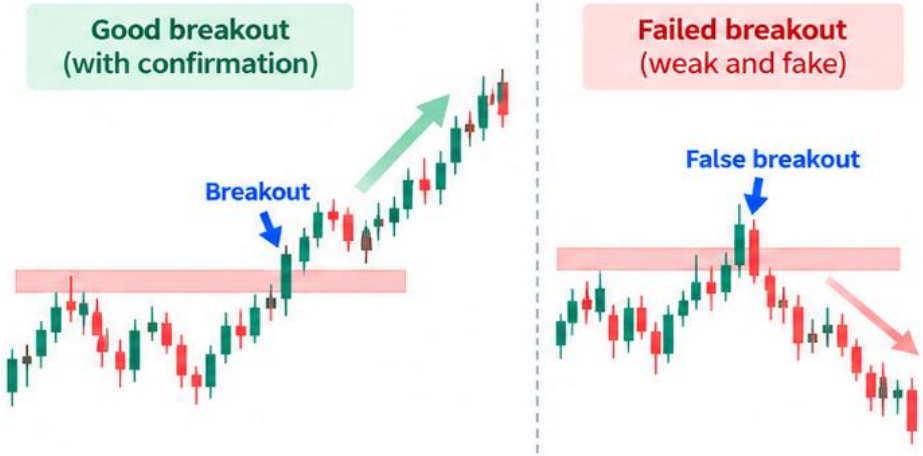

Tune exits

Keep winners open, but cut failed breakouts faster.

6 

Separate stock types

Trending stocks and sideways stocks may need different rules.

Control Question

Is the edge coming from the breakout entry itself, or mostly from the exit logic?

Final takeaway: The strategy is most effective when it selects high-quality breakouts and avoids noisy, low-conviction setups.

Dual Phase Strategy — BIST Test Results

Dual-Phase Reversal Strategy: How It Works

A reversal-based system that buys from lower pivot zones and exits into upper pivot zones

1 Identify the pivot structure
The strategy builds lower, middle, and upper pivot zones from recent price action.

2 Wait for a bullish reversal
A long trade appears when price rebounds from the lower zone and confirms the reversal.

3 Enter near the lower phase
The goal is to buy when downside pressure weakens and price turns upward.

4 Manage risk with the lower band
If the rebound fails, the lower zone helps define the risk boundary or stop area.

5 Exit near the upper phase
The trade closes on a sell signal, upper-zone reaction, or failed continuation.

Example: EREGL (Illustrative)

Green zone = Lower pivot / buy area
Blue line = Middle pivot
Red zone = Upper pivot / sell area
Green markers = Buy
Purple markers = Sell / reversal

Apr May Jun Jul Aug Sep Oct

Core idea: buy structured rebounds from lower zones and take profits as price reaches the upper phase.

Dual Phase Strategy — BIST Test Results

Backtest Results Across 6 BIST Stocks

Dual-Phase Reversal Strategy — summary of total profit, trade count, and win /loss breakdown

Stock	Net Profit	Total Trades	Winning Trades	Losing Trades
EREGL	+₺34k	4	3	1
TCELL	+₺17k	4	2	2
TUPRS	+₺76k	5	5	0
AKBNK	+₺68k	7	4	3
ASELS	+₺88k	4	3	1
FROTO	-₺23k	6	2	4

Key Insights

1. **Profitable stocks:** EREGL, TCELL, TUPRS, AKBNK, ASELS
2. **Only losing stock:** FROTO
3. **Best profit:** ASELS (+₺88k)
4. **Best win rate:** TUPRS (5 wins out of 5 trades)

Takeaway: the strategy was profitable on 5 of 6 stocks, but performance still depended on stock-specific reversıal quality.

Dual Phase Strategy — BIST Test Results

Why Results Differ Across Stocks

The same reversal strategy behaves differently in strong rebounds and in weaker, less reliable names

A) Strong reversal-friendly stocks

TUPRS **ASELS** **AKBNK** **EREGL**

- Price often rebounds cleanly from lower pivot zones.
- Winning trades can travel far enough to outweigh losses.
- Even a small number of trades can produce strong profits.

B) Mixed / difficult stocks

TCELL **FROTO**

- Some reversals work, but follow-through is less consistent.
- FROTO shows more failed rebounds and weaker continuation.
- Higher trade activity does not guarantee better performance.

Core idea: this strategy works best when lower-zone reversals lead to real upside follow-through.

Dual Phase Strategy — BIST Test Results

How to Improve the Strategy

Practical ideas for making dual-phase reversal entries more selective and more robust

1 Add a trend filter
Prefer long reversals when the broader trend is supportive.

2 Wait for cleaner confirmation
Avoid buying every touch of the lower zone; require a visible bounce.

3 Focus on stronger stocks
Names like TUPRS, ASELS, AKBNK, and EREGL showed better behavior.

TUPRS ASELS AKBNK EREGL

4 Cut failed rebounds faster
When price cannot hold the lower phase, exit earlier.

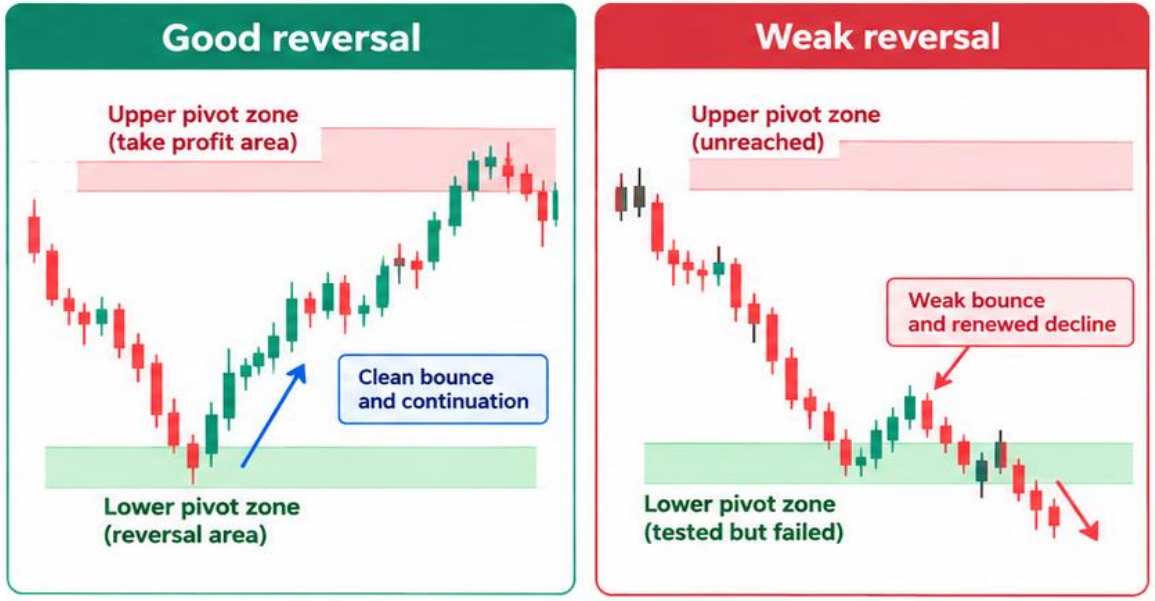

5 Keep good rebounds open
Let strong moves continue toward the upper pivot zone.

6 Separate stock types
Use stricter rules for weaker or noisier names such as FROTO.

FROTO

Control Question: is the edge coming from true reversal quality, or from only a few large winners?

Final takeaway: the strategy improves when it becomes more selective, protects weak rebounds, and stays with high-quality moves.
